DO YOU HAVE BODY MOVEMENTS YOU CAN’T CONTROL?

LEARN WHAT CAUSES TARDIVE DYSKINESIA (TD), WHAT IT LOOKS LIKE, AND HOW IT'S TREATED
If you’ve taken certain mental health medicines (antipsychotics) and experience mild to severe uncontrollable body movements, it could be tardive dyskinesia (TD).

**Diagnosis and treatment by a healthcare provider may make a real difference in your TD.**

After Shelly finally found a bipolar medicine that made her feel stable and productive, she started experiencing uncontrollable body movements. Her healthcare provider diagnosed her with TD.

"My husband and I noticed the symptoms, but we didn’t realize that these ‘tic-like’ movements were related to any kind of neurological condition."

Shelly and Matt were compensated by Neurocrine Biosciences, Inc. to share their story

**Shelly | LIVING WITH BIPOLAR DISORDER AND TARDIVE DYSKINESIA**

Even mild uncontrollable body movements from TD could have emotional and social consequences. These movements can cause worry, frustration, and self-consciousness.

If you’ve experienced mild, moderate, or severe uncontrollable movements, don’t wait—start a conversation with your healthcare provider today.

Results based on a survey of 397 people diagnosed with TD (n=173) or suspected of TD (n=224) who were asked, “Tardive dyskinesia may impact you in many different ways. To what extent has tardive dyskinesia impacted you in each of the following areas?” Answers ranged on a scale of 1 (not impacted at all) to 7 (extremely impacted).

**Take the first step. Start a conversation.**

Find psychiatrists, neurologists, and other healthcare providers experienced with diagnosing and treating TD. Talk about your uncontrollable body movements with them and learn about treatments that could make a real difference in your TD.

Use this brochure to learn how and why TD affects some people, and to start a conversation with a healthcare provider.
WHAT CAUSES TD?

Taking certain medicines (antipsychotics) to treat conditions like depression, bipolar disorder, schizoaffective disorder, or anxiety disorder is thought to cause too much dopamine activity in the brain.

Don’t stop or change your medicines without talking to your healthcare provider.

WHAT DOES TD LOOK LIKE?

Mild, moderate, or severe TD movements can occur in one or more spots in the body. They are often seen in the face, torso, limbs, and fingers or toes.

- **EYES**
  - Excessive blinking & squinting

- **JAW**
  - Repeated biting; clenching; side-to-side movements

- **LIPS**
  - Puckering; pouting; smacking

- **TONGUE**
  - Sticking out; darting; pushing inside of cheek

- **UPPER LIMBS**
  - Swaying; jerking movements

- **TORSO**
  - Shifting; rocking motion; leaning back

- **HANDS**
  - Twisting; finger dancing

- **LOWER LIMBS**
  - Separated or stretching toes; gripping feet; ankle twisting

HOW IS TD TREATED?

If you or someone you know is diagnosed with TD, it’s important to know that treatment options are available.

A recommended way to treat TD is with a type of prescription medication known as a VMAT2 inhibitor. VMAT2 inhibitors can be taken once or twice a day depending on which treatment your healthcare provider prescribes. These medicines are thought to reduce extra dopamine signaling.

As Jeff progressed with his schizophrenia medicine, he discovered that his uncontrollable body movements became persistent, which began to affect his day-to-day activities.

“When people see me grimacing, they come to the conclusion that there’s something wrong with me.”

TD is not a side effect. It’s a real, chronic condition that could impact your daily life.

Imagine life with fewer uncontrollable body movements from TD. Don’t wait. See the next page to learn how to start the conversation.
